

TAR 2023 — Lab 2

In order to be able to solve the assignment, please install `jupyter` if you don't have it already.

We advise you to install `conda` to manage your environment. You can install `jupyter` via `conda` or `pip` if you decide to use it for package management.

Create a new environment (e.g., `tarlab2`) with python 3.9 and activate the newly created environment.

```
conda create --name tarlab2 python=3.9
conda activate tarlab2
```

You can install `jupyter` directly in the activated environment:

```
conda install jupyter
```

It is important that your jupyter notebook is linked to the correct environment (`tarlab2`). We advise you to run `jupyter` once you've activated the environment.

You only need to install `podium` :

```
pip install podium-nlp
```

Submission deadline: **April 13, 2023, 23:59 CET**
